ICT CLASS VIDEO LECTURE

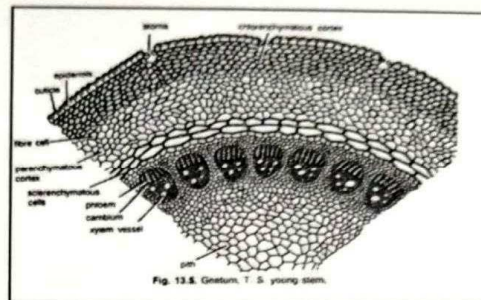

ICT LECTURE PPT SCIENCE FACULTY

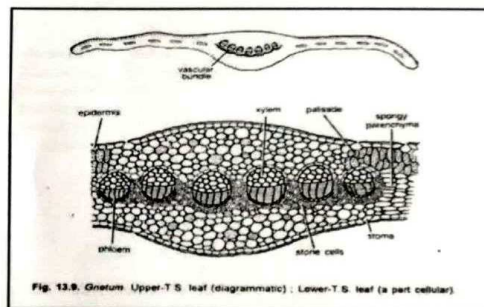

Anatomy of Stem

- ✦ The young stem in transverse section is roughly circular in outline, and resembles with a typical dicotyledonous stem.
- ✦ It remains surrounded by a single-layered epidermis, which is thickly circularized and consists of rectangular cells.
- ✦ Some of the epidermal cells show papillate outgrowths.
- ✦ Sunken stomata are present.
- ✦ The cortex consists of outer 5-7 cells thick chlorenchymatous region, middle few cells thick parenchymatous region and inner 2-4 cells thick sclerenchymatous region.
- ✦ Endodermis and pericycle regions are not very clearly distinguishable.
- ✦ Several conjoint, collateral, open and endarch vascular bundles are arranged in a ring in the young stem.
- ✦ Xylem consists of tracheids and vessels.
- ✦ Presence of vessels is an angiospermic character. Protoxylem elements are spiral or annular while the metaxylem shows bordered pits which are circular in outline.
- ✦ The phloem consists of sieve cells and phloem parenchyma.

Anatomy of Leaf

- ✦ Gnetum leaves also resemble with a dicot leaf.
- ✦ It is bounded by a layer of thickly circularized epidermis on both the surfaces.
- ✦ Stomata are distributed all over the lower surface except on the veins.
- ✦ The mesophyll is differentiated generally into a single-layered palisade and a well-developed spongy parenchyma.
- ✦ The latter consists of many loosely-packed cells.
- ✦ Many stone cells and latex tubes are present in the midrib region of the leaf.
- ✦ A ring of thick-walled stone cells is present just outside the phloem.
- ✦ Each vascular bundle is conjoint and collateral.
- ✦ The xylem of each vascular bundle faces towards the upper surface while the phloem faces towards the lower surface.
- ✦ The xylem consists of tracheids, vessels and xylem parenchyma while the phloem consists of sieve cells and phloem parenchyma.

Life Cycle of Gnetum

Prof. Abdul A. A.
Head, Dept. Botany

Distribution of Gnetum

Gnetum, represented by about 40 species is confined to the tropical and humid regions of the world. Nearly all species, except *G. microcarpum*, occur below an altitude of 1200 meters. Five species (*Gnetum contractum*, *G. gnemon*, *G. montanum*, *G. ula* and *G. latifolium*) have been reported from India (Fig. 13.1). Gnetum is the most commonly occurring species of India.

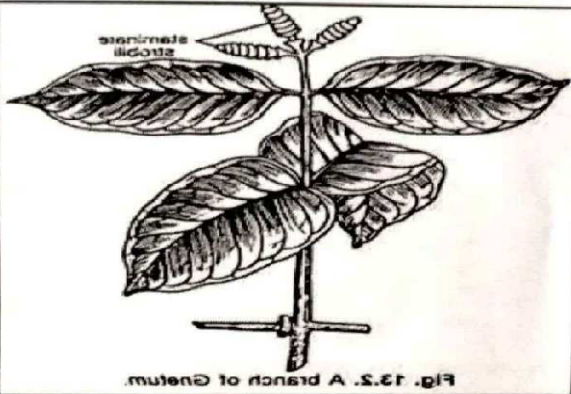

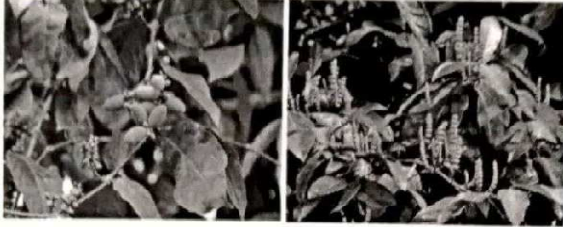

Fig. 13.2. A branch of Gnetum.

Habit of Gnetum

- ✦ The Gnetum species are climbers except a few shrubs and trees.
- ✦ Gnetum thymele is apparently parasitic.
- ✦ Two types of branches are present on the main stem of the plant, i.e. branches of limited growth and branches of unlimited growth.
- ✦ Each branch contains nodes and internodes. Stem of several species of Gnetum is articulated.
- ✦ In climbing species the branches of limited growth or short shoots are generally unbranched and bear the foliage leaves.
- ✦ The leaves (9-10) are arranged in decussate pairs.
- ✦ They often lie in one plane giving the appearance of a pinnate leaf to the branch.
- ✦ The leaves are large and oval with entire margin and reticulate venation as also seen in dicotyledons.
- ✦ Some scale leaves are also present.

Anatomy of Gnetum

(i) Root:

- ✦ Young root has several layers of starch-filled parenchymatous cortex, the cells of which are large and polygonal in outline.
- ✦ An endodermal layer is distinguishable.
- ✦ Casparian strips are seen in the cells of the endodermis.
- ✦ The endodermis follows 4-6 layered pericycle.
✦ Root are diarch and exarch.
- ✦ Small amount of primary xylem, visible in young root becomes indistinguishable after secondary growth.
- ✦ The secondary growth is of normal type.
- ✦ A continuous zone of wood is present in the old roots.
- ✦ It consists of tracheids, vessels and xylem parenchyma.

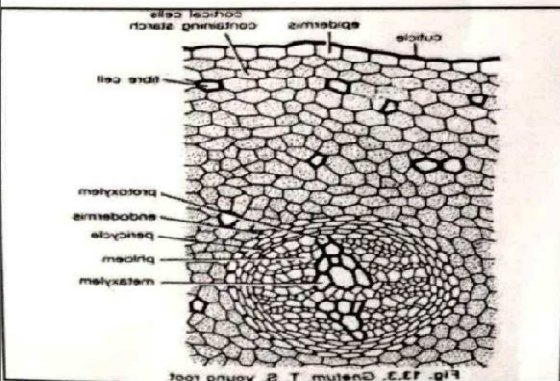

Fig. 13.3. Gnetum T. 2 young root.

Female Cone

- ◆ The female cones resemble with the male cones except in some definite aspects.
- ◆ A single ring of 4-10 female flowers or ovules is present just above each collar.
- ◆ Only a few of the ovules develop into mature seeds.
- ◆ In the young condition, there is hardly any external difference between female and male cones. All the ovules are of the same size when young but later on a few of them enlarge and develop into mature seeds.
- ◆ All the ovules never mature into seeds.

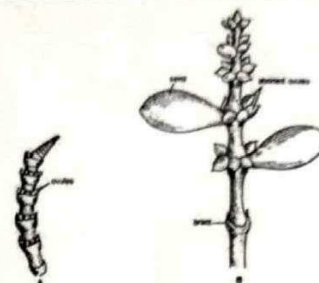

Fig. 12.15. Gnetum. A, An old female cone of G. ulm. B, A female cone of G. gnetum bearing two seeds.

Seed

- ◆ Gnetum seeds are oval to elongated in shape and green to red in colour.
- ◆ It remains surrounded by a three-layered envelope which encloses the embryo and the endosperm.
- ◆ Outer envelope is fleshy, and consists of parenchymatous cells.
- ◆ It imparts colour to the seed.

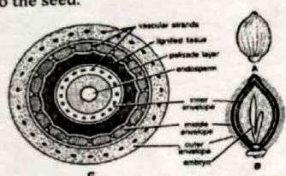

Fig. 12.26. Gnetum. A, An entire seed; B, L.S. seed; C, T.S. seed.

Germination of Seed

- ◆ Germination is of epigeal type.
- ◆ The cotyledons are pushed out of the seed.
- ◆ The hypocotyl elongates, and this brings the cotyledons out of the soil.
- ◆ The first green leaves of the plant are formed by the cotyledons.
- ◆ The first pair of foliage leaves is produced by the development of plumule.
- ◆ A persistent feeder is present up to a very late stage in the seed.

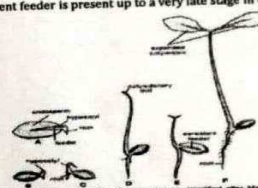

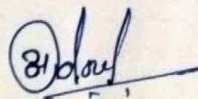

Fig. 12.27. Germination of seed in Gnetum gnetum. (Source: after M. J. G. & J. G. 1980)

Thank You
